

View unified service map and the impact paths in Service Operations Workspace

- Release version: Australia
-
- Updated March 12, 2026
-
- ⌚ 2 minutes to read

Visualize relationships between Configuration Items (CIs) and alerts with real-time updates and detailed impact paths. Enhance troubleshooting and proactive management by quickly identifying root causes and dependencies for both discovered services and application services.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

The enhanced service map in Service Operations Workspace displays the impacted path of an alert to enable you to quickly assess its impact on a service. You can access the enhanced service map directly from the Service Dashboard, or from the preview panel or from an impacted service in the Express List. The service map has several modes of display:

- For a service with up to 60 CIs, regardless of alert status, the map shows all CIs.
- For a service with more than 60 CIs without alerts, the map shows up to 60 CIs.
- For a service with more than 60 CIs with alerts, the map shows the impacted path of the most recent alert with the highest severity.

You can also investigate a wider view of the service topology on the service map for up to 250 CIs regardless of alerts. For a broader view, select Clear and choose a mode of either up to 60 or up to 250 nodes.

Note:

Admins can continue using the legacy service map to manage the propagation of severity.

Access the map by navigating to Services > Application Services.

Procedure

1. Navigate to Workspaces > Service Operations Workspace.

2. From the left navigation bar, select the Service Dashboard icon: .

The Service Dashboard page appears.

Note:

The application services that appear in the Service Dashboard are those added to the Impact Filter Services list. For more information, see [Add application services for impact calculation](#).

3. Select a service tile.

A pop-up window displays the business criticality and severity of a service.

4. Select Service Map.

The application map along with the CI relationships appears.

Note:

Depending on the size of the service, the unified map either shows the full map (if it contains up to 60 CIs) or an Impact Path leading to the most critical alert (for maps with over 60 CIs). For large maps, you can reveal more CIs by clearing the existing selecting and navigating to the Showing more nodes optimization option.

Impact Path shows alerts on the selected CI and all CIs within its impact subtree.

If the Impact path panel is closed, you can open it by selecting the Impact path icon ().

To view active alerts directly associated with the selected CI, select the Related items icon () in the right pane, then select Active Alerts.

5. Navigate between alerts by selecting an alert card.

Alternatively, use the search function to find an alert by description, CI, or alert number and focus on its impact path.

Selecting any alert tile displays the unified map for that alert. To return to the full map for the service, select Clear.

6. To view alert details, select the Open Record Form icon () on the alert card. The alert details page opens.

The screenshot shows the ServiceNow alert details page for the alert 'Number of threads is over 100'. The page is divided into several sections: Summary, Identified issue, Impact, Configuration item, Impacted services, and Cause. The 'Identified issue' section shows the description 'Number of threads is over 100'. The 'Impact' section shows the configuration item 'sow_large400/tail/1' and the impacted service 'service_sow_large400'. The 'Cause' section is currently collapsed. The 'Utilities' sidebar on the right contains links to launch various applications, including 'Launch App CMDB Group Visualisation', 'Launch App Search Google', and 'Launch App Dependency View'.

Name	Severity	Business criticality	Support group	Class
service_sow_large400	Critical	1 - most critical	(empty)	Mapped Application Service
