

Enable and disable live updates for alert lists

- Release version: Australia
-
- Updated May 5, 2026
-
- ⌚ 1 minute to read

Choose live updates for alert lists to receive real-time updates, or disable live updates and refresh the alert list manually.

Before you begin

Role required: evt_mgmt_user, evt_mgmt_operator, or evt_mgmt_admin

About this task

By default, the toggle for live updates is off, and you must enable it to receive live alert updates. Once enabled, the alert list automatically updates whenever an action is performed on an alert. Live updates enhance the accuracy and timeliness of the information displayed, enabling quicker response times, and improving overall system reliability and performance.

To update the alert list manually, you can switch the live updates toggle to off. Manual updates are useful when many alerts are being processed continuously, to avoid excessive refreshing.

Note:

Set Read Role permissions to the Event Management user (evt_mgmt_user). Otherwise, the property won't be available.

Procedure

1. Navigate to Workspaces > Service Operations Workspace.
2. From the navigation bar, select the List icon: .
3. Select the Default lists tab.
4. Under Alerts, select the list where you want to enable or disable live updates.

Note:

Live updates aren't available for the All Alert list.
5. At the top of the alert list, select the toggle switch to turn live updates on or off.
 - When live updates are turned on, the setting is saved for future logins by the same user.
 - When live updates are off, the refresh button displays a counter to show the number of changes since the last refresh. You can select the refresh button

anytime to update the list manually.
