- ⌚ 1 minute to read

Add custom fields from the Alert [em\_alert] table to the Express List Info preview panel to track alert information.

## Before you begin

Role required: evt\_mgmt\_operator, evt\_mgmt\_admin

## Procedure

1. Navigate to System Properties > All Properties.
2. In the System Properties list, select evt\_mgmt.express\_list.custom\_fields.

If a message appears about the application scope, select here to be able to edit the record.

3. In the Value field, enter the custom name from the Alert [em\_alert] table.  
If you want to provide more than one field, use commas to separate the field names.
4. Select Update.
5. **Optional:** View the custom fields on the preview panel:
  - a. In the primary navigation, select the Express List icon ().
  - b. Select a row or the information icon at the beginning of a row.

## Result

The Info tab on the preview panel displays the custom fields at the bottom of the fields list.
