Select View correlations to view the list of correlations that relate the Log Analytics alerts.

Correlations list

During initial analysis, alerts are scored. Each correlation in the alert's log data with another alert contributes to the score. The higher the score, the more likely the alert is to be included as a Log Analytics alert in a Log Analytics group.

The following kinds of data are considered when determining whether alerts are correlated:

- Time: The events all occurred within a configured time interval.
- Metadata: The alerts have matching values in log-line metadata. For example, all alerts involve the same host.
- Message text: The message text in the log data is similar or identical between alerts.
- Trend: The alerts show a similar tendency in values or rates. For example, a particular metric value is increasing in all alerts.

Figure 2. Correlations

The screenshot shows a window titled "Correlations" with a close button (X) in the top right. Below the title is the instruction "Expand a correlation to view its related alerts".

1. A red bracket on the left side of the window indicates the list of correlations. The first correlation, "Anomaly Trend Up: UP", is expanded and highlighted with a blue border. A red arrow labeled "2" points to the blue square containing the number "2" at the end of this correlation.

2. A table below the expanded correlation shows the related alerts. A red arrow labeled "3" points to the first two rows of the table.

Alert	Application service	Component
Alert0011802	Pet Clinic	spring
Alert0011803	Pet Clinic	Spring

3. Below the table, there are four expandable filters, each with a blue square containing the number "2":

- Application service: pet clinic
- Assigned Host: Many
- ip: 15.0.1.157
- method: get

A "Close" button is located at the bottom right of the window.

1. List of correlations: The first correlation in the list is expanded to show the individual Log Analytics alerts that are correlated and the log correlator that the alerts share.
2. An individual log correlator: The identifier for a group of correlated Log Analytics alerts. The alerts are grouped by the log-line data or metadata that is common to the alerts (for example, IP address, host name, or user name). The number in the blue square indicates the number of correlated alerts.
3. Log Analytics alerts that are correlated.

Alerts in group

For a Log Analytics alert, the Alerts in group card shows the Log Analytics alerts that are grouped under the Log Analytics alert. Select a Log Analytics alert to view its details.

Figure 3. Alerts in group

Alerts in group ²				
Number	Description	State	Initial event generation time	Anomaly
Alert0010187		Closed	2022-05-31 00:44:00	17 Events per minute, Typically inactive
Alert0010186		Closed	2022-05-31 00:44:00	16 Events per minute, Typically inactive

Select View all to view the list of all Log Analytics alerts in the group and relevant information about them. You can also view the Alerts in group list by selecting the Related records tab and then selecting Alerts in group. For more information, see View the Log Analytics alerts in a Log Analytics group in Health Log Analytics

Impact

Configuration Items

This card provides information about the CIs that are impacted by the alert.

Impacted services

This card provides information about the services that are impacted by the alert.
