

View the Log Analytics alerts in a Log Analytics group in Health Log Analytics

- Release version: Australia
-
- Updated March 12, 2026
-
- ⌚ 2 minutes to read

View a list of all Log Analytics alerts in a Log Analytics group on the Related records tab.

Before you begin

Role required: evt_mgmt_operator, or evt_mgmt_user, or evt_mgmt_admin

About this task

For a detailed description of Log Analytics groups and Log Analytics alerts, see Types of Health Log Analytics alerts.

Procedure

1. On the Overview tab for a Log Analytics alert, go to the Alerts in group card and select the View all link.

The Alerts in group section on the Related records tab displays.

Figure 1. Alerts in group section on the Related records tab

The screenshot shows the 'Alerts in group' section on the 'Related records' tab. The interface includes a top navigation bar with 'List' and 'Alert0010185' tabs. Below this is a 'Details' section with a 'Group of alerts, issue identified in mid' card. The card displays metadata: Priority group (High), Severity (Critical), State (Closed), Initial event generation time (2022-05-31 00:43...), Group (Log Analytics), and Task (CHG00000001). The 'Related records' tab is active, showing a list of alerts. The left sidebar contains a list of categories: Impacted services (0), Service offerings (0), Probable root causes (0), Alerts in group (2), Configuration items (0), and Remediation tasks (0). The 'Alerts in group (2)' category is selected. The main content area displays a table with the following data:

Number	Initial event generation time	Description	Priority group	Severity	Source
Alert0010187	2022-05-31 00:44:00		Low	Warning	Log Analytics
Alert0010186	2022-05-31 00:44:00		Low	Warning	Log Analytics

At the bottom, there is a pagination bar showing 'Showing 1-2 of 2' and a '20 rows per page' dropdown.

2. For each Log Analytics alert in the Log Analytics group, the information described in the table is available.

Table 1. Alerts in group

Column	Description
Number	The number of the alert. Select the number to view detailed information for an alert. This field is automatically set.
Initial event generation time	The time when the event that generated the alert first occurred. Note: Time here is the ServiceNow processing time, not the source system time.
Group	Type of group that the alert belongs to: a standalone Log Analytics alert or a Component-based alert.
Description	Anomalous pattern or metric that caused the alert to be generated.
Severity	Severity value for the alert. The available values are: ◦ Critical: Immediate action is required. Either the resource is not functional or critical problems are imminent. ◦ Major: Major functionality is severely impaired or performance has degraded. ◦ Minor: Either performance has degraded or there is a partial, non-critical loss of functionality. ◦ Warning: Attention is required even though the resource is still functional. ◦ Info: An informational message. An alert is created, but the resource is still functional. ◦ Clear or Resolved: No action is required. An alert is not created from this event. Existing alerts are closed.
Priority group	Priority group that indicates the order in which to resolve alerts. Choices are as follows:

Column	Description
	◦ Urgent ◦ High ◦ Moderate ◦ Low The priority group value is more important than severity alone. For example, a high priority and low severity alert should be addressed before a low priority and high severity alert. For information on how priority is calculated, see Alert priority.
State	Processing state of the alert. A newly generated alert is in the Open state. Other states are as follows: ◦ Reopen: A previously closed alert is open again, and it requires your attention. ◦ Flapping: The alert is receiving identical events from the same source at high frequency. This state can cause an alert to re-open from the Closed state, resulting in a high frequency of changes between Open and Closed states. ◦ Closed: The alert is closed and does not require any further action. You close an alert when it is remediated.
Configuration item	CI in the CMDB. The CI is applied to by the alert.
Node	Node field that is received in the log message. The event described in the log message occurred on this node. Often, the node is the name of the CI that is associated with the alert. For example, a computer name, IP address, FQDN, or MAC address.
Source	All Health Log Analytics alerts have the value Log Analytics in the Source column to indicate that the Health Log Analytics app generated the alert.
Metric name	Name of the metric whose anomalous behavior led to the alert. For example, the I/O

Column	Description
	request in the case that the I/O request took longer than 15000 ms to complete.
Updated	Most recent time when the alert information or state was updated.
