The table lists the node attributes available in Link View with their icon and description.

Note:
"Attribute" is a generic term that represents fields and tags found on the alerts or configuration items (CI).

Table 1. Attributes in Link View

Attribute name	Icon	Description
Impacted service		Service in the Configuration Management Database (CMDB) impacted by an alert on a CI.
Resource		Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Source		Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Region		Predefined attribute extracted from connector payload.

Attribute name	Icon	Description
Location		Predefined attribute extracted from connector payload.
Assignment group		Alert assignment group.
Environment		Predefined attribute extracted from connector payload.
Metric		Unique name that describes which metric data is collected.
IP address		Predefined attribute extracted from connector payload.
CI		JSON string that represents a configuration item. For example, <code>{"name": "SAP ORA01", "type": "Oracle"}</code> . The CI identifier that generated the event appears in the Additional information field. Maximum length: 1000 characters.
Node		Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.

Attribute name	Icon	Description
Application		Predefined attribute extracted from connector payload.
Process		A process or a cluster of processes running on the host that are identified by the horizontal discovery.
Component		A logical part of a service instance where the alert was detected, with one component shown for each child alert.
Service		Attribute extracted from the log file. The impact of this alert on the service might not be clear or defined.
Host		Attribute extracted from the log file. It might not be identified in the CMBD.
User		Attribute extracted from the log file.
Account		Attribute extracted from the log file.
Path		Path or route extracted from the log file.

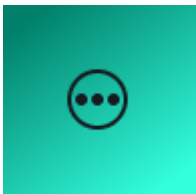

Attribute name	Icon	Description
Request id		The request ID extracted from the log file.
URL		Web address or URL extracted from the log file.
Detection		An identified anomaly on a metric measured by Health Log Analytics.
Other Note: This attribute is user-defined. All the other attributes are predefined in the system.		User-defined attribute. Note: All the other attributes are predefined in the system.

Table 2. Lines linking attributes

Link	Visual representation	Description
Solid line		Solid line linking attributes in Link View, indicating that the attributes share one or more alerts.
Dotted line		Dotted line linking attributes in Link View, indicating that the attributes are correlated by grouping criteria.
