

Alert field mapping on the Respond page

- Release version: Australia
-
- Updated March 12, 2026
-
- ⌚ 1 minute to read

The fields to be configured on the Respond page, when selecting an action to be triggered by an alert automation.

Table 1. Select automation actions fields

Field	Description
Incident field name	Name of the field that will appear in the incident.
Map field	Option that indicates how the incident field is to be mapped: • Same as: The selected incident field will have the same value as the indicated alert field. • To: The selected incident field will be set to a specified value.
Alert field value	Value that will be set in the alert field: • If you select Same as in the Map field column, the alert field value that you want to appear in the incident field also appears in the Incident field name column. • If you select To in the Map field column, enter the alert field value that you want to appear in the specified incident field.

To return to the procedure, see [Create Respond automation](#).
