

Integration and configuration health event fields

- Release version: Australia
-
- Updated March 12, 2026
-
- ⌚ 1 minute to read

Populate the event fields to capture details such as the event time, description, alert number, state, severity, metric name, node, message key, and error message, enabling precise tracking, effective incident management, and improved error analysis.

Table 1. Event fields

Field	Description
Time of Event	Indicates when the event occurred.
Description	Provides details about the event or incident.
Alert	Specifies the alert number that is triggered based on the event.
State	Describes the current state of the event (e.g., open, closed).
Severity	Indicates the severity level of the event (e.g., critical, warning).
Metric Name	Identifies the specific metric associated with the event.
Node	Specifies the node or device related to the event.
Message Key	Unique identifier for the event message.
Error Message	Provides additional information about any errors associated with the event.

To return to the procedure, see [Review integration and configuration health](#).
