

Event Management

- Release version: Australia
-
- Updated March 12, 2026
-
- ⌚ 1 minute to read

ServiceNow® Event Management is a robust application that helps keep your IT systems healthy by spotting problems quickly and fixing them. It collects events from different sources, figures out what's causing the issues, and converts them into alerts. These alerts are then analyzed, grouped, and acted upon to resolve issues and maintain system health.

Event Management seamlessly integrates with various monitoring tools via connectors and listeners, enabling comprehensive data collection and correlation. Available as a separate subscription from the main ServiceNow platform, Event Management allows organizations to tailor their usage to specific needs, ensuring effective and efficient incident management without unnecessary overhead.

Get started

 Explore Explore the various types of alert grouping and the rules for correlation	 Configure Event Management Setup	 Use View alert information and monitor service health
 Integrations Learn how you can integrate Event Management with other monitoring systems	 Event processing Understand the analysis and management of events	 Reference Get details about domain separation in Event Management
